

Experiment integrity and artefact pipeline

Pinned source, verified configuration, retained checkpoints and common evaluation preserve comparability

**Pin source and
record hashes**

**Audit configuration
and optimiser groups**

**Run real-data CUDA
and DDP preflight**

**Train with per-epoch
last checkpoint**

**Validate best minADE6
checkpoint**

**Publish compact
evidence and retain
large files locally**

Traceability record

source revision -> resolved configuration -> selected checkpoint -> common evaluation -> repository artefact

A result is admitted only when every element of this chain is retained
